READING THIS GUIDE

Each chapter is one task. Screenshots carry **numbered marks**; the list under the picture explains each number.

Names you click or type in the editor look like **Save template**. Keys look like Ctrl S.

THE HOMES IN THE PICTURES

Whitepeak Tower, Aldamar and Lakeview Manor, in a load order of about 300 plugins. Your homes and numbers will differ; the steps are the same.

01

WHAT THE EDITOR IS FOR

Dova Stash sorts your loot into the containers of a player home. A **template** tells it which container takes what in one particular home. The editor makes templates for you, outside the game.

OPEN A HOME

Every home of your load order, under the mod that adds it.

SET UP THE CHESTS

Click it in 3D or on the plan: master, categories, or ignored.

CHECK AND SAVE

The same checks the game runs, then one file in its own mod.

FIGURE 1 Breezehome as the editor draws it, from your own meshes and textures.

A TEMPLATE SAYS

- which container is the **master**, where anything without a place goes,
- which **categories** each other container takes (potions, ingots, books…),
- which containers to **ignore** (ones that respawn or belong to someone),
- which racks, mannequins and shelves to fill.

YOU NEED

- Windows 10 or 11 with Direct3D 11,
- Skyrim Special Edition or Anniversary Edition, set up with Mod Organizer 2 (or a plain Data folder),
- Dova Stash installed. The editor comes with it.

The editor only reads your game and mod files. It never changes a plugin. It writes template files only, into a mod of their own.

02

INSTALL AND ADD IT TO MO2

The editor is one program, `DovaStashEditor.exe`. It is already in the Dova Stash download, in the mod's **Tools** folder. Add it to Mod Organizer 2 once, like xEdit.

1. In MO2, open **Tools** › **Executables** (the gears icon), press **+** and choose **Add from file...**
2. Browse to your Dova Stash mod folder, open **Tools** and pick `DovaStashEditor.exe`.
3. Fill in the fields as below, then press **OK**.
4. Pick **Dova Stash Editor** in MO2's run list (top right) and press **Run**.

EDIT EXECUTABLES	WHAT TO ENTER
Title	Dova Stash Editor
Binary	`<MO2 folder>\mods\Dova Stash\Tools\DovaStashEditor.exe`
Start in	`<MO2 folder>\mods\Dova Stash\Tools`
Arguments	`--mo2 "<MO2 folder>" --gui` optional: run from MO2, it finds the instance itself
Create files in mod instead of overwrite	leave off the editor writes into its own mod

WITHOUT MO2

Double-click the exe, or start it from a terminal with `--mo2 "<MO2 folder>"`. Outside MO2 it rebuilds the same view of your Data folder by itself, so it gives the same answers. With no MO2 at all, point it at the game with `--data "<Skyrim>\Data"`.

THE FIRST START

The editor finds MO2's instance and profile, reads your load order (about two seconds for 300 plugins) and lists your player homes. If it cannot find the instance, it asks once for the folder and remembers it.

TIP

To open one home straight away, add it to the arguments: `--gui --home "Whitepeak Tower"`. `--gui --mod 92177` starts with that Nexus id in the homes search.

03

THE WINDOW

Everything happens in one window: your homes on the left, the home in the middle, its details on the right. Before you open a home, the middle shows the start panel.

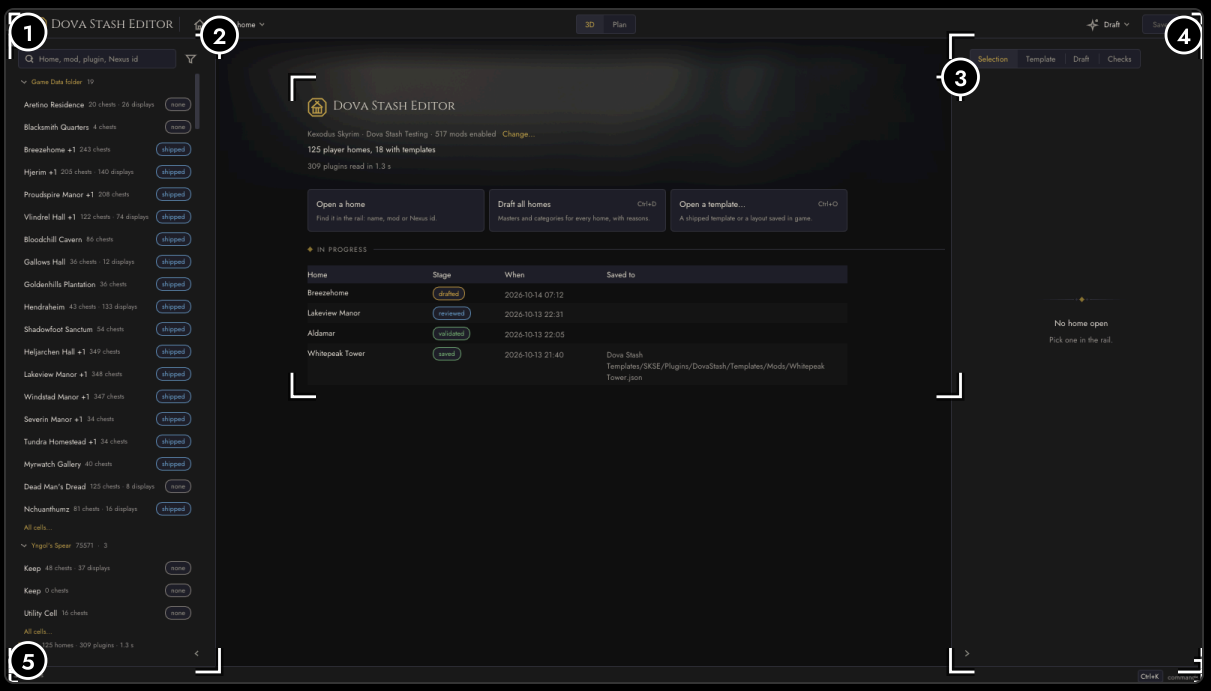

FIGURE 2 The window before a home is open: the homes rail, the start panel with the homes in progress, and the inspector.

1. **Title row.** ≡ menu, the home you have open, **3D | Plan**, **Draft**, **Save** and ⚙ Setup (MO2 folder, profile, author).
2. **Homes rail.** Every home of your load order, under its mod (chapter 04).
3. **Start panel.** Your setup, how many homes have a template, and three ways in: **Open a home**, **Draft all homes**, **Open a template…**
4. **Inspector.** **Selection**, **Template**, **Draft** and **Checks** for the open home.
5. **Status row.** Home and cell, errors and warnings, what is loading, and one useful key.

With a home open, a drawer under it holds the wide tables (**Containers**, **Displays**, **Doors**, **Where items go**), and Ctrl K finds any command, home or container by typing. Click the emblem for the start panel again: **In progress** lists each home you opened, with its stage. Click one to carry on.

STAGES

DRAFTED — You opened it. →

REVIEWED — You accepted or rejected a suggestion, or edited it. →

VALIDATED — Reviewed, and no problems left. →

SAVED — Written to disk. The list shows where.

Stages, your MO2 folder, author name and the window's layout are kept between runs, in `%LOCALAPPDATA%\DovaStashEditor\state.json`.

04

OPENING A HOME

You know a home by its mod. The rail on the left lists every home of your load order under the mod that adds it; a name or a Nexus id finds it.

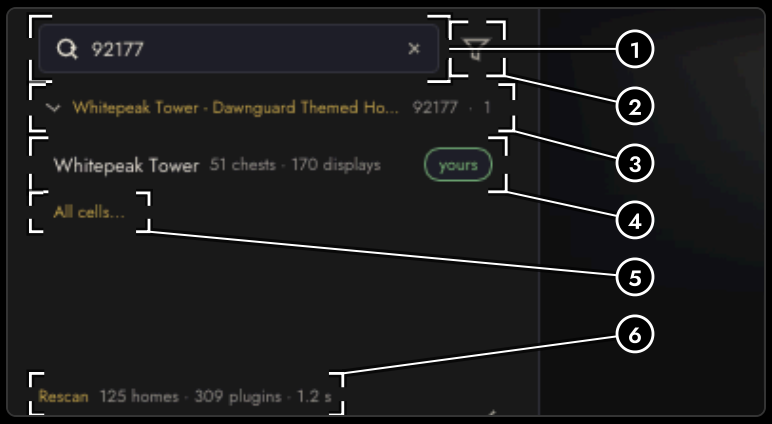

FIGURE 3 The homes rail, searched by Nexus id: the mod, its home and the last scan.

1. **Search.** Part of the home or mod name, a plugin, or the Nexus id (`92177` is Whitepeak Tower).
2. **Filter**: only homes without a template, only enabled mods, and more. A number shows how many are on.
3. **The mod** with its Nexus id.
4. **The home**: its chests and displays, and a chip: *none*, *shipped*, *yours*, *drafted* or *saved*. Click it to open it.
5. **All cells...** of this mod, for a home that is not listed.
6. **Rescan** (F5) and what the last scan read.

HOW THE EDITOR FINDS HOMES

It reads every cell of your load order once and keeps the homes: a player-house location, owned by the player, or mannequins and nothing that respawns. Each sits under the mod whose plugin adds it; base-game and DLC homes sit under **Game Data folder**. **Rescan** reads it again after you change mods in MO2.

A home owned by a faction, or an exterior, is not listed. Click **All cells...** under its mod: every cell of its plugins with containers is ranked, likely homes first. Untick **Likely homes only** in the filter to see them all.

The rail stays beside the home while you go from one to the next; ↑ ↓ and Enter work too, and right-click a home for more. Ctrl 1 or its ‹ folds it to a strip. The home's name in the title row is the same list, for a quick switch.

MOVING AROUND IN 3D

DO THIS	TO
Hold right mouse, move the mouse	Look around
Right mouse held + W A S D, Q E	Fly; Q and E go down and up. Shift is 4× faster, Alt slower
Mouse wheel	Move forward or back (with right mouse held: change speed)
Middle drag · Alt + left drag	Pan · orbit around the selection
F · Home	Frame the selection · back to the overview
Left click · double-click a door	Select · open the cell behind the door

THE 3D VIEW

The home as it looks in game, built from your own meshes and textures. It opens from above while the meshes load; the status row shows the progress.

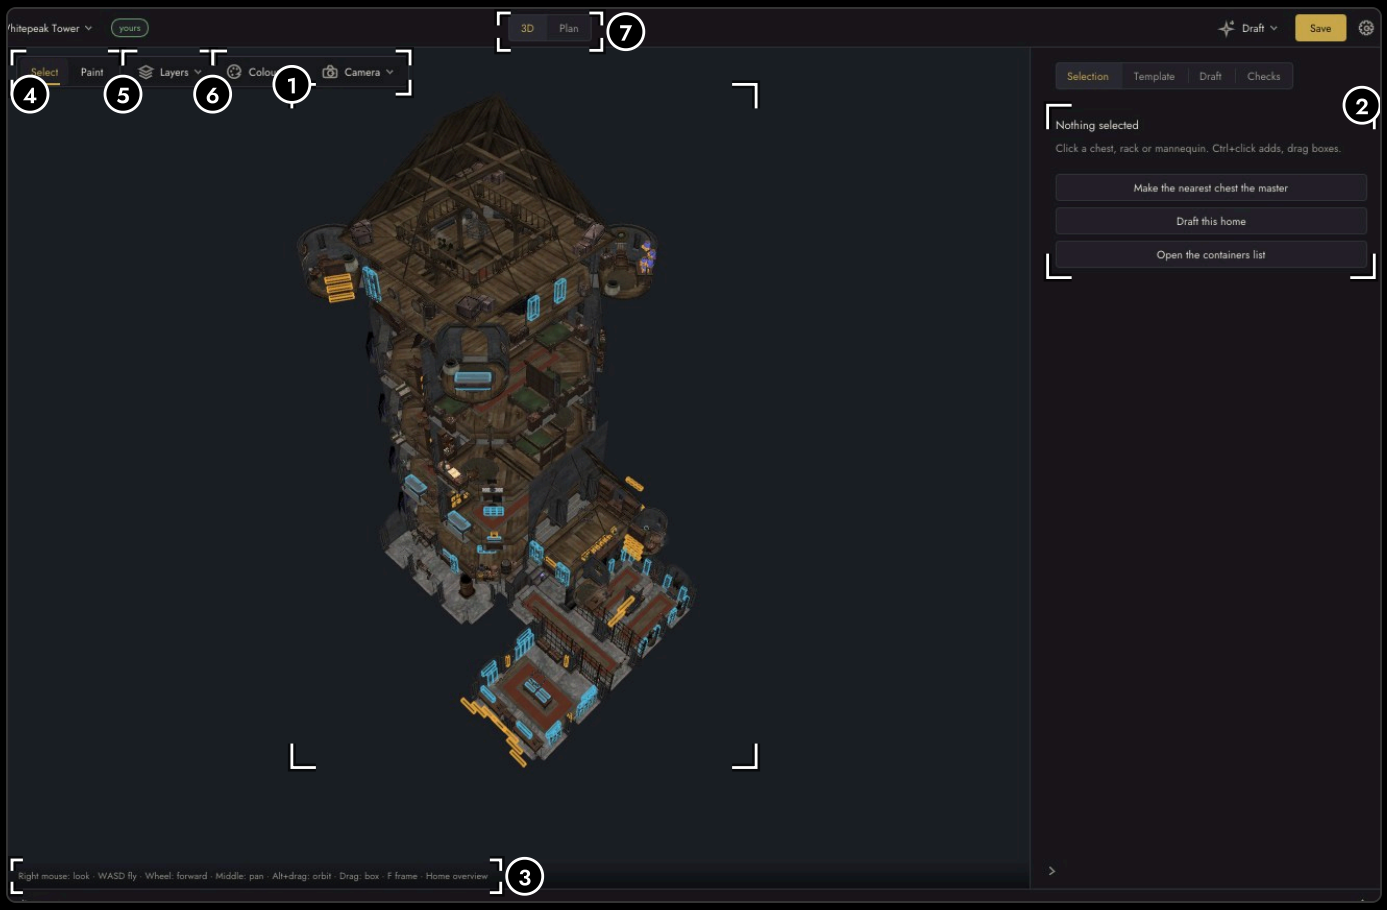

FIGURE 4 A home open in the 3D view (Whitepeak Tower, from above), with the viewport's toolbar: Select, Paint, Layers, Colours, Camera.

1. **The home.** Hover anything to see its name; click to select it.
2. **Inspector.** With nothing selected: **Make the nearest chest the master**, **Draft this home**, **Open the containers list**.
3. **Hint line**: the controls for the mode you are in.
4. **Select** picks what a template can use; S lets it pick anything. **Paint**: chapter 07.
5. **Layers** (L). Hide structure, people, disabled upgrades or effects. **Height cut** shows one floor of a tower.
6. **Colours** (chapter 10) and **Camera**: **Overview** (Home), **Frame** (F), speed, light.
7. **3D | Plan** (1 2), in the title row.

WHAT THE COLOURS MEAN

Things you cannot see in game but a template can use, such as hidden chests and rack triggers, are drawn as see-through boxes: green containers, red respawning containers, blue weapon racks, magenta mannequins, orange plaques and cases, yellow doors, lavender furniture. A gray checker is a texture the editor could not find; it does not matter for the template.

05

THE FLOOR PLAN

Press **Plan** in the title row (2). The plan draws every object's footprint from above, north up. It is the fastest way to find a room or pick something that is hard to reach in 3D. Plan and 3D view share one selection.

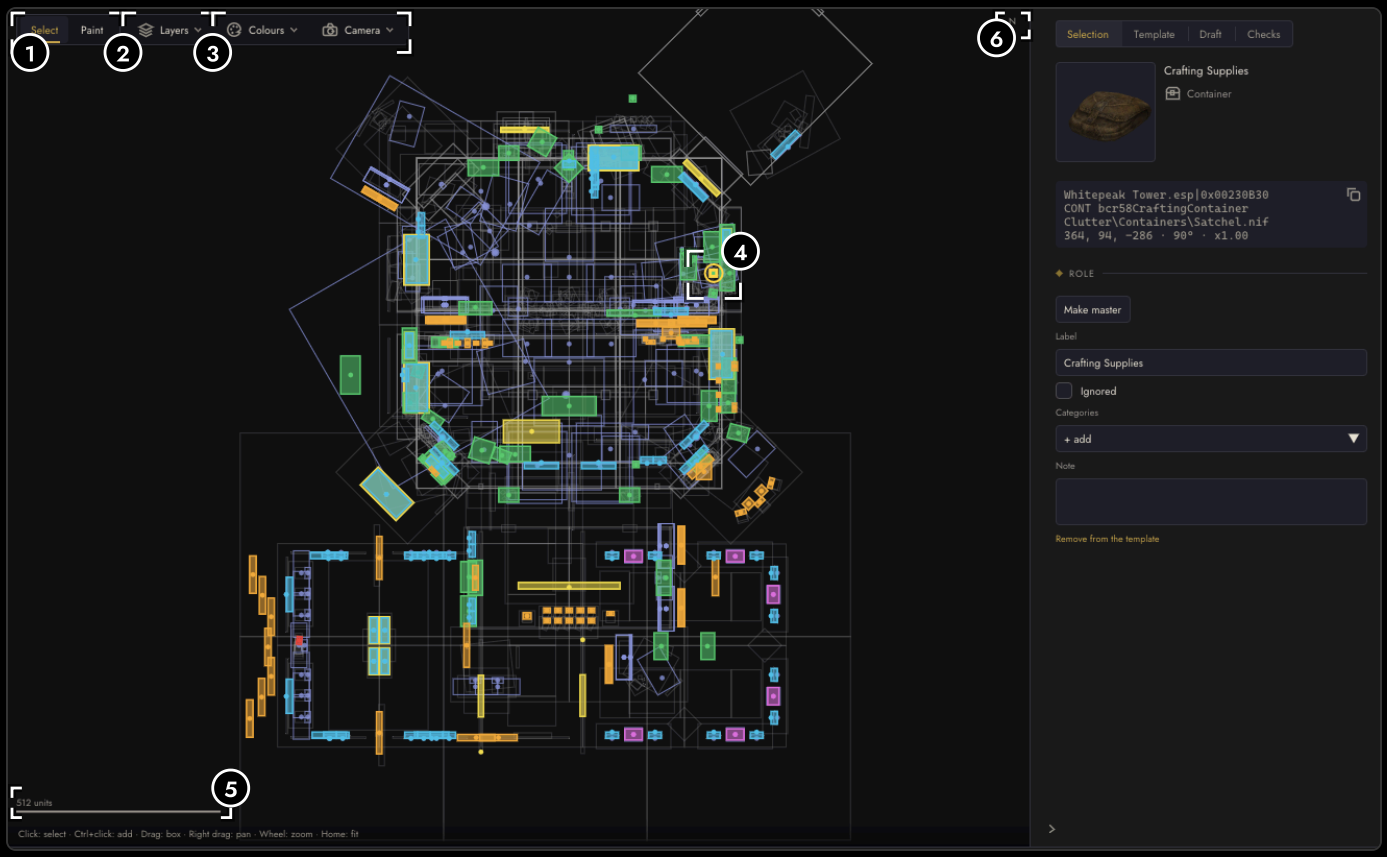

FIGURE 5 The floor plan: the same home seen from above, north up. The selected satchel is marked on the plan and open in the Selection panel.

1. **Select** and **Paint**, as in the 3D view.
2. **Layers**: structure, containers, displays, doors, furniture, other, and **Height cut**: the lowest and highest heights shown. Narrow it to see one floor.
3. **Colours** and **Camera**, as in the 3D view. Home fits the whole home in view.
4. **The selection**, marked on the plan.
5. **Scale bar**, in game units.
6. **North.**

ON THE PLAN

- Mouse wheel zooms, right or middle drag pans.
- Left click selects, left drag draws a box. Press S to make left drag pan instead.
- Hover a footprint to see its name.

THEN IN 3D

Select a chest on the plan, press 1 for the 3D view and F. The camera finds a side of it where no wall is in the way.

06

SETTING UP CONTAINERS

Click a container in 3D, on the plan or in the drawer's **Containers** tab. The inspector's **Selection** panel shows what it is, its reference and base object, then, under **Role**, its job in the template.

FIGURE 6 Selected in 3D: the potion basket gets a yellow frame and the Selection panel opens on the right, its mesh next to its name.

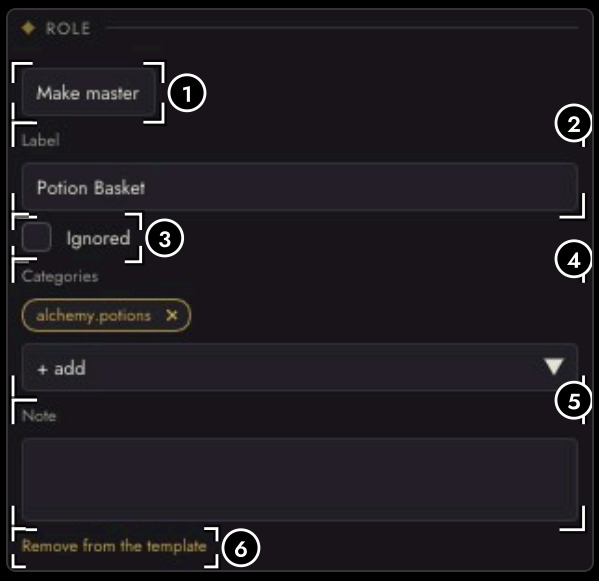

FIGURE 7 A container's role in the Selection panel.

1. **Make master**: this container takes everything without a place of its own, and is the hotkey's target. A home has one master; the old one becomes a plain container.
2. **Label**: the name players see. It starts as the game's name.
3. **Ignored**: Dova Stash never uses it.
4. **Categories** it takes. **+ add** opens the category tree; **×** on a chip removes one.
5. **Note** for people who read the file.
6. **Remove from the template**: it is no longer listed (unlisted containers stay unused).

CHOOSING THE MASTER

Pick a large chest near the front door that never respawns. It is the home's inbox: whatever has no container of its own ends up there. The master's role shows a *master* chip and offers **Not the master**.

CATEGORIES

Categories come from Dova Stash's category files, the same ones the game uses. They form a tree: `alchemy.potions`, `misc.ores_ingots`, `weapons.staves`. A name ending in `.*` takes the whole group, so `weapons.*` takes every weapon. When two containers take the same items, the more exact category wins.

IGNORE WHAT IS NOT SAFE

FIGURE 8 A respawning urn: the draft already ignores it, with the reason as its note.

1. **Respawns.** Containers that reset lose what you put in them. The editor marks them in red and never makes one the master.
2. **Ignored** is ticked.
3. **The reason** goes in the note, so other players know why.

Ignore containers that respawn, belong to someone else, or disappear with a house upgrade. The draft (chapter 09) does this for you and writes the reason.

EVERY CONTAINER IN ONE TABLE: THE DRAWER

FIGURE 9 The drawer's Containers tab lists every container with its role; click a row to select it.

1. **Role**: its categories, *no categories*, *ignored* or *not listed*.
2. **Reference**. Click a row to select it; double-click to look at it in 3D. Hidden chests you cannot click are reachable here.

GOOD TO KNOW

A container with no categories still matters: it stays empty, and its items go to the master. In **Where items go** (chapter 10) it shows as *receives nothing*. Ctrl 2 opens or folds the drawer; drag its top edge to make it taller.

07

FASTER EDITING

PAINT MODE

Press P (or **Paint** in the toolbar), pick a category, then click containers, racks and mannequins to give it to them. Click again to take it away. The master, respawning and ignored containers tell you why they cannot be painted.

FIGURE 10 Paint mode with alchemy.potions picked: the paint bar takes the toolbar's place. Colours switch to "by category" while you paint.

1. **Paint** on: the paint bar, with the category to paint, **Pick another** and **Done**.
2. **By category** colours; the key is under **Colours**.
3. **Click a container** to give it the category; click again to take it away.
4. **Hint line**: what a click does now. P or S stops painting.

> **TIP**
> Paint a room at a time: narrow **Layers** › **Height cut** to one floor, pick a category, and click every chest that should take it. Painted containers change colour at once, so you see what is left. While painting, Ctrl K and a few letters pick the next category.

UNDO AND REDO

Every change to the template can be undone: Ctrl Z undoes, Ctrl Y (or Ctrl Shift Z) redoes, or use **Undo** and **Redo** in the ≡ menu. A text field counts as one step once you leave it. The editor keeps 200 steps, also while you move between the home's cells.

MULTI-SELECT

Ctrl + click adds or removes one object, in 3D, on the plan or in the drawer's tables. Drag a box to select every container and display inside it (hold Ctrl to add). Esc clears the selection; Delete takes it out of the template.

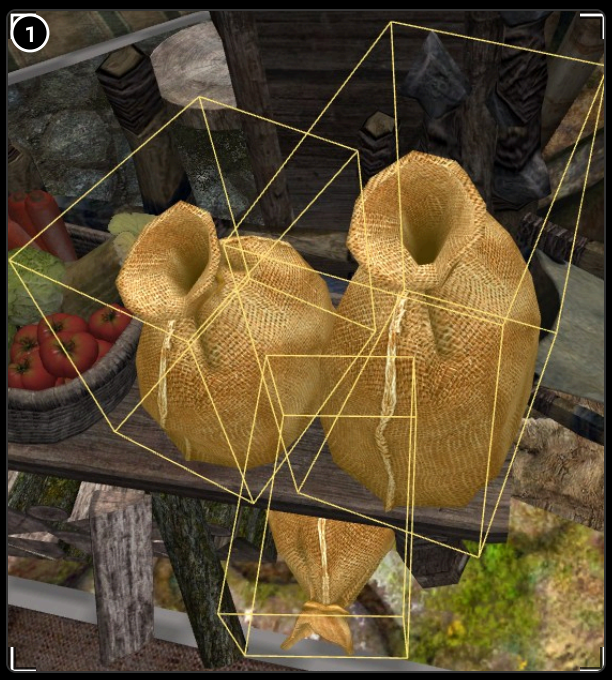

FIGURE 11 Three sacks selected at once.

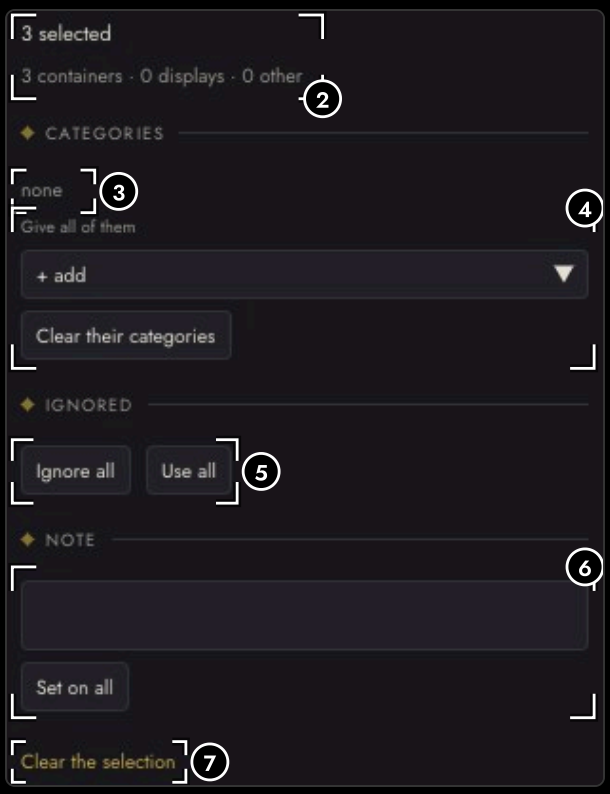

FIGURE 12 The Selection panel edits them together.

1. **Three sacks**, each in its own frame.
2. **How many** are selected, by kind.
3. **Categories of the selection**, with how many have each (1 of 3). **x** takes it from all.
4. **Give all of them** a category, or **Clear their categories**.
5. **Ignore all** or **Use all**.
6. **One note** for all of them (**Set on all**).
7. **Clear the selection** (Esc).

UNSAVED CHANGES

While a template has changes that are not saved, a dot follows the home's name in the title row, in the status row and in the rail, and the chip next to its name reads *draft*. Opening another home keeps them: the dot stays on its row until you save. Closing the window asks first.

08

DISPLAYS

Racks, mannequins, plaques, display cases and bookshelves are **displays**. Dova Stash fills the ones the template uses with your best gear. Nothing is ever taken off a display.

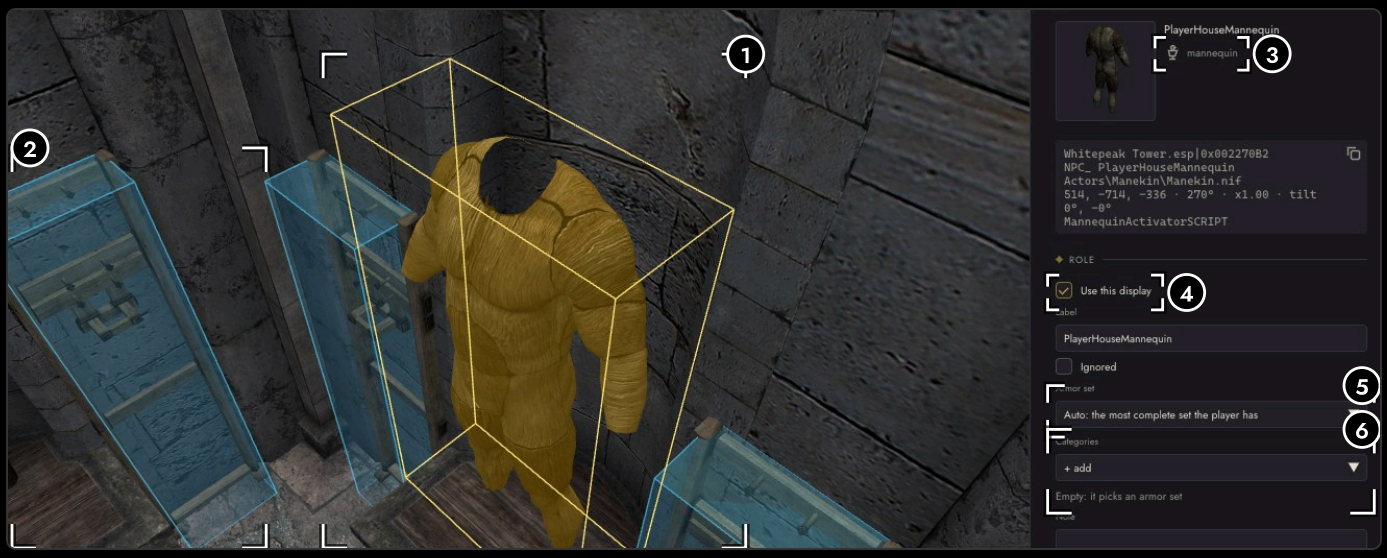

FIGURE 13 A mannequin selected in Whitepeak Tower. The blue see-through boxes are weapon-rack triggers.

1. **The mannequin**, selected.
2. **Rack triggers**, drawn as blue see-through boxes so you can click them.
3. **Display: mannequin** and the script that makes it one.
4. **Use this display**: Dova Stash fills it. Untick to leave it alone.
5. **Armor set**: *Auto* wears your most complete set; pick one (type to search every set of your load order) and it wears only that set, filling up as you get its pieces.
6. **Categories**, for *Auto* only. Empty: any set.

FIGURE 14 A shield rack: its kind decides what fits.

1. **Kind** of rack: any weapon, no daggers or bows, daggers, or a shield.
2. **Use this display.**
3. **Categories**: `armor.shields` here; a bow rack could take `weapons.bows`.
4. **Empty** means any weapon that fits the rack.

Plaques and display cases

Each keeps what its own script was made for, such as a dragon priest mask. The editor lists those items for you.

Bookshelves

Listed in the drawer's **Displays** tab with the racks and plaques. Give one categories (skill books, spell tomes, notes) or leave it empty for the books most worth showing.

09

DRAFTS

You never start from nothing: a home opens with a draft, a template the editor made from the home itself. The inspector's **Draft** panel shows what it suggests and why. Open it with the **Draft** tab, **Draft** › **Draft this home** in the title row, or right-click a home in the rail.

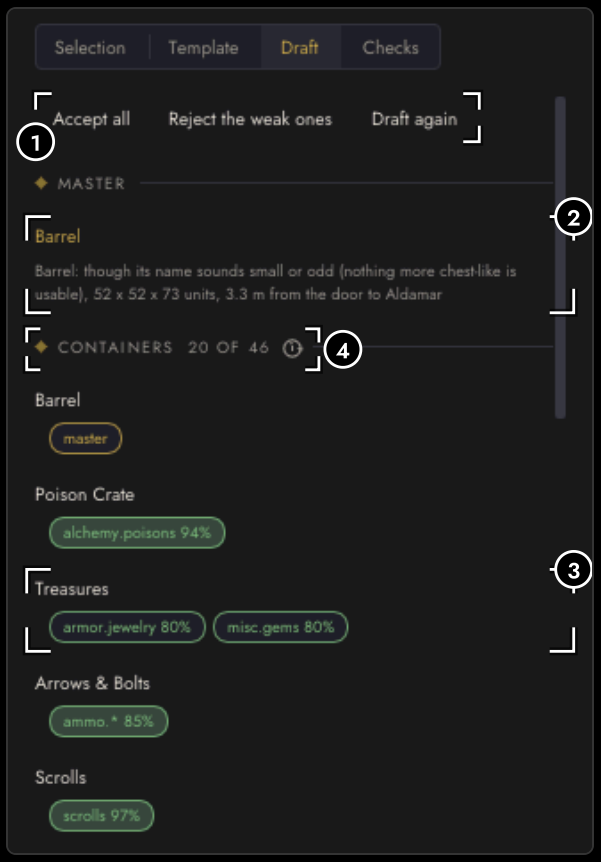

FIGURE 16 The Draft panel for Aldamar: its master and each container's suggestions.

1. **Accept all**, **Reject the weak ones** (under 50%), **Draft again** (from the home's plugins).
2. **The master** and why it was chosen. Hover it for the whole reason and the next best.
3. **Suggested categories** per container, as chips with a confidence. Click a chip to accept or reject it; hover it to read its reason. Click a container's name to find it in the view.
4. **How many** containers got a suggestion. **Displays** the draft uses are folded at the end; problems are in the **Checks** panel.

COLOURS AND CONFIDENCE

Green: the container's name says so. **Yellow**: a crafting station or items nearby. **Orange**: a weaker hint, such as the kind of furniture. The number is the confidence. Each category goes to one container and is accepted from 50%; the chips left off are the alternatives (*Potion Basket has it with 93%*).

The Draft panel works on the template itself: a chip you accept is a category of that container at once, in the **Selection** panel, the checks and **Where items go**. Ctrl Z takes it back.

DRAFT ALL HOMES

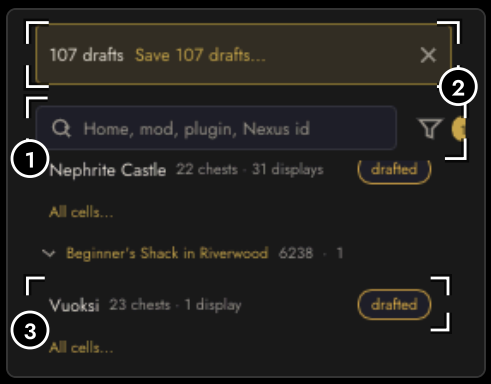

FIGURE 17 The homes rail after Draft all homes: a drafted chip per home and the Save N drafts... banner.

Ctrl D (or **Draft all homes** in the ≡ and **Draft** menus, or on the start panel) drafts every home of your load order at once. The status row shows the progress; you can keep working.

1. **Search and filter**: **Only homes without a template** finds the ones still to do.
2. **Save N drafts...** saves every draft of a home without a template at once, after one question.
3. **Every home** with its chip: *drafted* once it has a draft. Open one to review it in the **Draft** panel.

WHERE THE SUGGESTIONS COME FROM

The name

A container called *Soul Gems*, *Ingots* or *Potion Basket* takes those, and only those. Homes with named containers come out nearly complete. A name the editor cannot read, such as *Dragonpriest Masks*, gets nothing: you decide.

What is near it

A chest by the forge gets ores and ingots; one by the alchemy lab, ingredients and potions. Items placed on it add to that; decoration, like a shield on the wall, says nothing.

The master

A chest near the front door, never one named for what it holds. Containers that respawn, are owned, or are scripted are never chosen.

The rest

Common groups nobody took (clothes, books, food...) go to the free container with the best hint, such as a dresser for clothes or a safe for jewelry.

REVIEWING A DRAFT

1. Open the home from the rail and pick the **Draft** panel.
2. Read the master and its reason. If it is wrong, select another container and press **Make master**.
3. Go down the containers. Click the chips that fit on, the others off. **Reject the weak ones** clears the low ones in one go.
4. Finish in the same window: rename labels, set up displays, check **Where items go**.
5. Press **Save** (Ctrl S). Or review several homes and save them all with **Save N drafts...** (homes without a template only): each keeps its draft while you open the next.

> **HOMES THAT ALREADY HAVE A TEMPLATE**
> The Draft panel says how many categories the draft sends to the same container as the existing template, and whether the master is the same. Saving asks first; the old file is kept as a backup.

10

WHERE ITEMS GO

The drawer's **Where items go** tab runs Dova Stash's own sorting over a sample of loot and shows which container would get what, with the home still in view above it. It runs again by itself whenever the template changes.

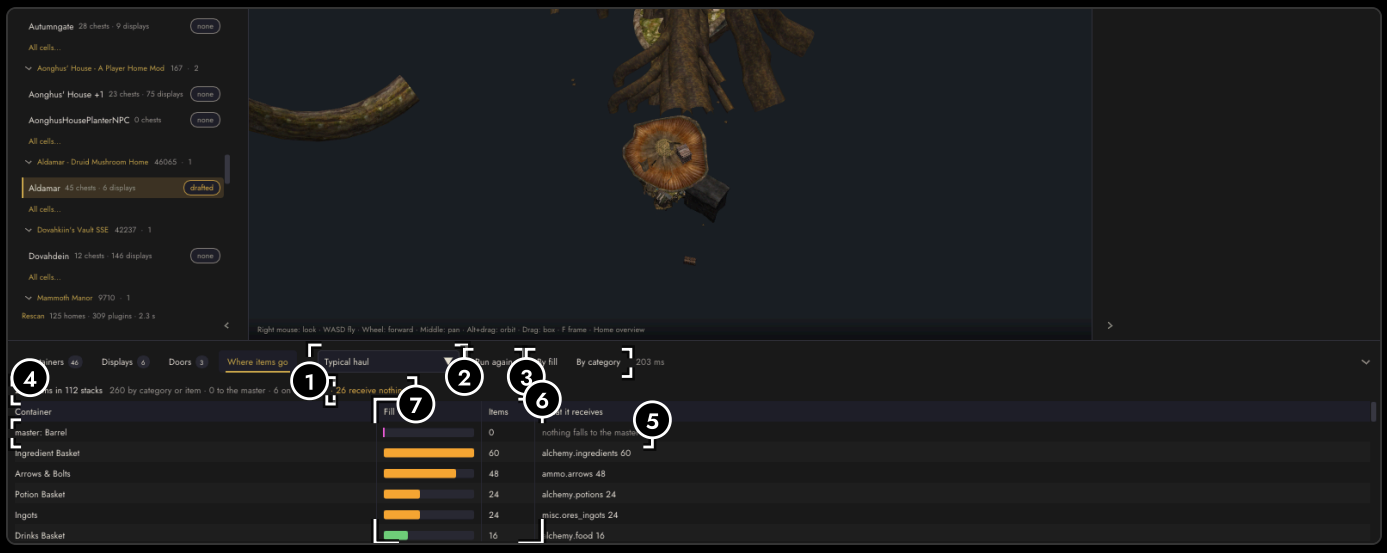

FIGURE 18 Where items go for Aldamar's draft, with the typical haul, under the home.

1. **Sample**: *Typical haul*, *One category*, or *Every item in the load order*.
2. **Run again** (R).
3. **Colours** for the 3D view and the plan: **By fill**, **By category**.
4. **Summary**: how much goes to containers, the master and displays.
5. **The master**: what has no other place. Here, nothing.
6. **Fill** and item counts, per category.
7. **Receives nothing**, and why: give it categories or ignore it.

SAMPLES

Typical haul	A handful of each kind of loot, base-game items first (about 110 stacks). The quick everyday check.
One category	Every item of your load order in one category, such as `alchemy.*`: does all of it land where you expect?
Every item in the load order	One of each playable item, modded ones included. Shows what still falls to the master.

SEE IT IN THE HOME

Press **By fill** (V): every container in the 3D view or on the plan takes the colour of how much it would get. Click one to list its items in the **Selection** panel, under **Where its items go**.

FIGURE 19 Colours by fill in 3D. The master, a barrel by the door, is selected; the green box beside it gets a few items.

1. **The key**, under **Colours**: gray receives nothing, green a few (under 20), orange many, magenta the master.
2. **Containers** that get a few items.
3. **Master container**, selected.
4. **Its preview**: nothing falls to the master, so every item found a place.

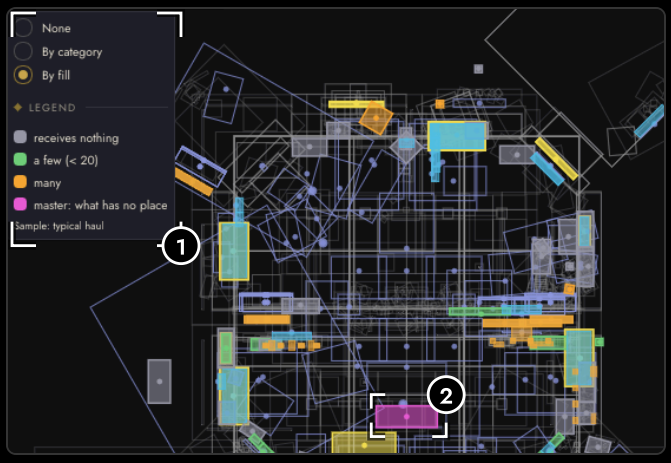

FIGURE 20 The same colours on the floor plan.

1. **The same key** on the plan.
2. **The master**, in magenta.

By category

Press **By category** (C) to colour each container by its first category instead, one hue per group: you see at a glance where the alchemy, the weapons and the materials live.

FIGURE 21 Colours by category: each container takes its first category's colour, one hue per group.

11

MULTI-CELL HOMES AND DOORS

Many homes are more than one cell: a cellar, a tower, the grounds with the forge. The drawer's **Doors** tab lists where the home's doors lead, so you can add those cells to the same home. A home the editor already knows as several cells opens with all of them.

FIGURE 22 The drawer's Doors tab for Lakeview Manor: the cellar and the two exterior cells around it.

1. **Open** the cell behind the door. The template comes along; **Back** (‹ in the title row) returns.
2. **In the home**: tick to make that cell part of this home.
3. **Where it leads**: another interior, or the exterior cells around the home.

ADDING A CELL

1. Open the home, then **Doors** in the drawer.
2. Tick **In the home** next to the cellar, or press **Open**, select a chest there and press **Add this cell to the home**.
3. Set up its containers as usual. In 3D, double-click a door to walk through it.

ONE FILE PER HOME

However many cells, the home is saved as one template. Its cells are listed in the **Template** panel with their names (*Cellar*, *Grounds*), which players see in game; × takes one out.

Exteriors open with their terrain and the cells around them, so you can find the forge outside.

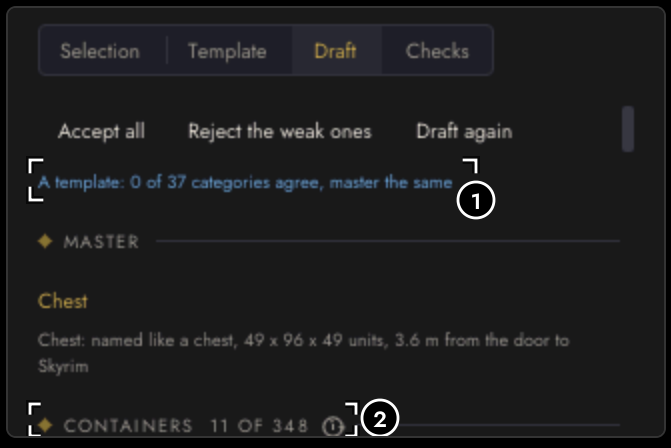

FIGURE 23 Lakeview Manor's Draft panel: one home over two cells, compared with its shipped template.

1. **The shipped template** and how far the draft agrees with it.
2. **Containers of every cell**, 348 over the two. One in another cell says so; click it to open that cell.

12

CHECKING AND SAVING

The template is checked the way the game will check it while you work. The status row counts errors and warnings; click it for the **Checks** panel. The **Template** panel holds the template's details and saves it.

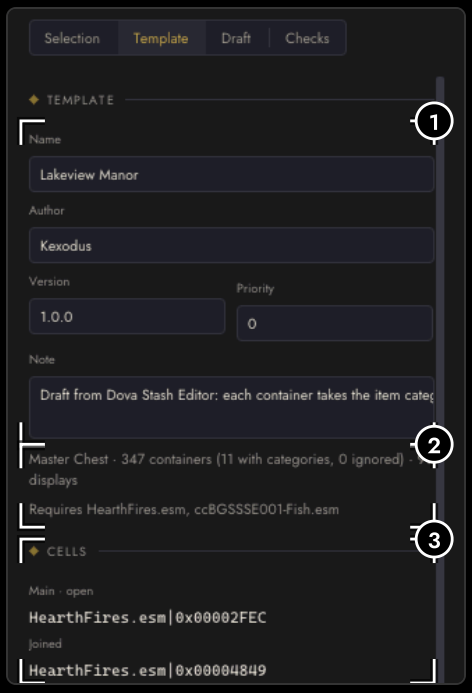

FIGURE 24 The Template panel: details, summary and cells.

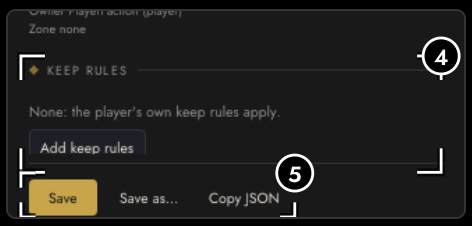

FIGURE 25 Keep rules, and the Save footer.

1. **Name, Author, Version, Priority, Note.** Your author name is remembered.
2. **Summary**: master, containers with categories, ignored, displays, plugins required.
3. **Cells** of the home.
4. **Keep rules** for this home: what players always or never keep on them, and how many of a category. None: their own rules apply.
5. **Save** (Ctrl S) into the Templates mod (**Save to**, above the footer, picks another), **Save as...** a copy anywhere, **Copy JSON**.

Checks lists the problems, errors first: click one to select the object. Fix every error before you share; **Save** waits until there are none. Under **Still to do** it lists what the template lacks, such as containers without a role.

WHERE IT GOES

Into a mod of its own, **Dova Stash Templates**, created when missing:

`mods\Dova Stash Templates\SKSE\Plugins\DovaStash\Templates\<Author>\<Home>.json`

Never MO2's overwrite folder, so cleaning overwrite cannot delete it.

THEN

1. In MO2, press F5 and enable **Dova Stash Templates** (first save only).
2. In game, look at a container in that home, press the hotkey and pick the template.

Saving over a file asks first, keeps the old one as a `.bak` and raises the version (1.0.0, 1.0.1...). ⚙ Setup picks another mod to save into.

13

TROUBLESHOOTING AND FAQ

It says it cannot find my MO2 instance.

Type the MO2 folder on the start panel and press **Open**, or use **Browse...**. Or add `--mo2 "<MO2 folder>"` to the executable's arguments.

My home is not in the list.

Check the mod is enabled in the profile, then **Rescan**. Still missing: click **All cells...** under its mod, and in the filter untick **Likely homes only** or tick **Exteriors**.

Where is that button?

Press Ctrl K and type what you want: a command, a home, a container.

Make master is grayed out.

That container respawns. Its contents can vanish, so it can never be the master; ignore it.

My template does not show up in game.

Press F5 in MO2 and enable **Dova Stash Templates**. Then fix any errors in its **Checks** panel.

Can it break my game?

No. It never edits plugins or game files. It only writes template files into its own mod.

How do I share a template?

Upload the `.json` file, keeping its `SKSE\Plugins\DovaStash\Templates\` folders. The template lists the plugins it needs.

The text is too small (or too big).

Ctrl = and Ctrl - step the text size, Ctrl 0 is back to *Auto*; ⚙ Setup › **Text size** has the same. It is remembered.

The wrong profile is loaded.

Pick another under ⚙ Setup › **Profile**. The editor reads that profile's mod list and load order.

I cannot click a chest.

It may be hidden or behind a wall. Select it in the drawer's **Containers** tab, or turn off **Structure** under **Layers**.

Some surfaces are a gray checker.

The editor could not find that texture. It does not affect the template.

A container "receives nothing".

It has no categories, or none of the sample matches them. Give it categories, or ignore it.

I saved over a template by mistake.

The old file is next to it as a `.bak`. Rename it back to `.json`.

Can I edit a template I already have?

Yes: **Open a template...** (Ctrl O) opens a shipped or downloaded template, or a setup you saved in game, on its home.

The window stays black.

The editor needs Direct3D 11. Update your graphics driver.

Where are my settings kept?

In `%LOCALAPPDATA%\DovaStashEditor\state.json`: the MO2 folder, profile, author, each home's stage and the window's layout.

14

CONTROLS REFERENCE

3D VIEW

Right mouse held	Look around
W A S D	Fly (right mouse held)
Q E	Down, up (right mouse held)
